**The Maximum Power Dissipation on Regulator:**

$$P_{D(MAX)} = V_{OUT(MAX)} \times I_{OUT(NOM)} + V_{IN(MAX)} \times I_Q$$

$V_{OUT(MAX)}$  = the maximum voltage on output pin;

$I_{OUT(NOM)}$  = the nominal output current;

$I_Q$  = the quiescent current the regulator consumes at  $I_{OUT(MAX)}$ ;

$V_{IN(MAX)}$  = the maximum input voltage.

**Thermal Consideration:**

The A705 has internal power and thermal limiting circuitry designed to protect the device under overload conditions. However, maximum junction temperature ratings should not be exceeded under continuous normal load conditions. The thermal protection circuit of A705 prevents the device from damage due to excessive power dissipation. When the device temperature rises to approximately 150°C, the regulator will be turned off. When power consumption is over about 700mW (SOT-89 package, at  $T_A=70^\circ\text{C}$ ) or 1000mW (TO-252 package, at  $T_A=70^\circ\text{C}$ ), additional heat sink is required to control the junction temperature below 120°C.

The junction temperature is:

$$T_J = P_D (\theta_{JT} + \theta_{CS} + \theta_{SA}) + T_A$$

$P_D$  : Dissipated power.

$\theta_{JT}$  : Thermal resistance from the junction to the mounting tab of the package.

$\theta_{CS}$  : Thermal resistance through the interface between the IC and the surface on which it is mounted.  
(typically,  $\theta_{CS} < 1.0^\circ\text{C/W}$ )

$\theta_{SA}$  : Thermal resistance from the mounting surface to ambient (thermal resistance of the heat sink).

If PC Board copper is going to be used as a heat sink, below table can be used to determine the appropriate size of copper foil required. For multi-layered PCB, these layers can also be used as a heat sink. They can be connected with several through-hole vias.

PCB $\theta_{SA}$ ( $^\circ\text{C/W}$ )	59	45	38	33	27	24	21
PCB heat sink size ( $\text{mm}^2$ )	500	1000	1500	2000	3000	4000	5000
